

MOTOR HEAVY DUTY

HMR-02. SELF-REGULATING MOTORS FOR OPEN AND CLOSED CIRCUITS.

Design characteristics

- >> high pressure axial piston motor in swash plate design for closed and open loop systems
- >> optimised start-up and low-speed characteristics
- >> optionally with purge valves for circuit and case flushing
- >> HP valves possible
- >> through-shaft with bare shaft end or coupling flange
- >> SAE High pressure ports, radial or axial
- >> SAE mounting flange with ANSI or SAE spline shaft
- >> plug-in version optional
- >> speed sensor optional

Product advantages

- >> smooth low-speed operation
- >> high starting torque
- >> lower emissions through speed reduction
- >> compact design
- >> high power density
- >> high reliability
- >> long service life
- >> highly dynamic response characteristics
- >> simplified drive line

LinDrive = Precision x Dynamics x Reliability = Benefit^o

LINDE HYDRAULICS PRODUCT RANGE

TRANSMISSION CONCEPT.

Equipment manufacturers profit by the Linde Hydraulics transmission concept. Due to the direct conversion of the prime mover speed into wheel speed it is possible to reduce the number of drive line components and the energy losses in the operating cycle.

Speed steps of transmission concepts

Starting torque

Linde hydraulic motors offer uniformly high torque for smooth start up. Right from the start.

Torque at 350 bar and 2 rpm

of a bent axis motor

of a swashplate motor

OPERATIONAL PARAMETERS. LIFE TIME RECOMMENDATIONS

Linde high pressure units are designed for excellent reliability and long service life. The actual service life of a hydraulic unit is determined by numerous factors. It can be extended significantly through proper maintenance of the hydraulic system and by using high-quality hydraulic fluid.

Beneficial conditions for long service life

- >> Speed lower continuous maximum speed
- >> Operating pressure less than 300 bar Δp on average
- >> Max. pressure only at reduced displacement
- >> Viscosity 15 ... 30 cSt
- >> Power continuous power or lower
- >> Purity of fluid 18/16/13 in accordance with ISO 4406 or better

Adverse factors affecting service life

- >> Speed between continuous maximum speed and intermittent maximum speed
- >> Operating pressure more than 300 bar Δp on average
- >> Viscosity less than 10 cSt
- >> Power continuous operation close to maximum power
- >> Purity of fluid lower than 18/ 16/ 13 in accordance with ISO 4406

Operational parameters. Filtration

In order to guarantee long-term proper function and high efficiency of the hydraulic motors the purity of the pressure fluid must comply with the following criteria according to Linde Works Standard WN 51 210. High purity oil can extend the service time of the hydraulic system significantly.

- >> For reliable proper function and long service life 18/16/13 in accordance with ISO 4406 or better
- >> Minimum requirements 20/18/15 in accordance with ISO 4406
- >> Commissioning The minimum purity requirement for the hydraulic oil is based on the most sensitive system component. For commissioning we recommend a filtration in order to achieve the required purity.
- >> Filling and operation of hydraulic systems The required purity of the hydraulic oil must be ensured during filling or topping up. When drums, canisters or large-capacity tanks are used the oil generally has to be filtered. We recommend the implementation of suitable measures (e.g. filters) to ensure that the required minimum purity of the oil is also achieved during operation
- >> International standard

Code number according to ISO 4406		purity class according to SAE AS 4059E
18/16/13	corresponds to	8A/7B/7C
20/18/15		9A/8B/8C

OPERATIONAL PARAMETERS. PRESSURE FLUIDS

In order to ensure the functional performance and high efficiency of the hydraulic motors the viscosity and purity of the operating fluid should meet the different operational requirements. Linde recommends using only hydraulic fluids which are confirmed by the manufacturer as suitable for use in high pressure hydraulic installations or approved by the original equipment manufacturer.

Permitted pressure fluids

- >> Mineral oil HLP to DIN 51 524-2
- >> Biodegradable fluids in accordance with ISO 15 380 on request
- >> Other pressure fluids on request

Linde offers an oil testing service in accordance with VDMA 24 570 and the test apparatus required for in-house testing. Prices available on request.

Recommended viscosity ranges

Pressure fluid temperature range	[°C]	-20 to +90
Working viscosity range	[mm ² /s] = [cSt]	10 to 80
Optimum working viscosity	[mm ² /s] = [cSt]	15 to 30
Max. viscosity (short time start up)	[mm ² /s] = [cSt]	1000

In order to be able to select the right hydraulic fluid it is necessary to know the working temperature in the hydraulic circuit. The hydraulic fluid should be selected such that its optimum viscosity is within the working temperature range (see tables).

The temperature should not exceed 90 °C in any part of the system. Due to pressure and speed influences the leakage fluid temperature is always higher than the circuit temperature. Please contact Linde if the stated conditions cannot be met in special circumstances.

Viscosity recommendations

Working temperature [°C]	Viscosity class [mm ² /s] = [cSt] at 40 °C
approx. 30 to 40	22
approx. 40 to 60	32
approx. 60 to 80	46 or 68

Further information regarding installation can be found in the operating instructions.

TORQUE TRANSMISSION.

Depending on the selected components, different torques may be transferred. Please ensure that the load transfer components such as mounting flange and PTO through-shaft are designed adequately. Our sales engineers will be pleased to provide design advice.

Torque transmission of the hydraulic motor

The diagram Torque transmission of HMF / A / V / R-02 shows the output side A and the PTO through-shaft B of a motor. The information on the following pages refers to

TORQUE TRANSMISSION. PTO THROUGH-DRIVE MOTOR

Based on a standard Series O2 variable hydraulic motor with single shaft end, the PTO Through-Drive Motor features two shaft ends for torque transfer. This enables the hydraulic motor to be installed directly in the drive line without transfer gearbox, reducing noise emission and fuel consumption. At the same time the overall efficiency increases.

| 4 Directional control valves | 9 Tank |
| 5 Hydraulic cylinder | 10 Venting valve |

Further information about the LSC system is available in the data sheets "HPR-02" and "VT modular" or directly from our sales engineers.

FUNCTIONS. PURGE AND CASE FLUSHING

Purge and case flushing is used

- >> for reducing the temperature of the motor and the system in the open and closed loop circuits
- >> for replacing the oil in the circuit
- >> to enhance filtration and
- >> for removing air from the system

For equipment options for Series 02 motors please refer to the model code.

Purge flow in closed loop circuit

Version	Purge valve pressure CBV setting	Diagram	Purge Flow	Diameter of orifice
Standard	10 bar with 20 bar feed pressure	3	10 l/min	2.5 mm
Standard	14 bar with 20 bar feed pressure	2	10 l/min	without orifice
Restricted	10 bar with 20 bar feed pressure	3	5 l/min	2 mm
Restricted	14 bar with 20 bar feed pressure	3	5 l/min	2.5 mm
Increased	10 bar with 20 bar feed pressure	2	20 l/min	without orifice
Flow controlled	14 bar with >20 bar feed pressure	4	4 l/min	with flow regulator

Purge valve 1. Without (0 l/min)

Purge valve 2. Standard and increased

Purge valve 3. Restricted

Purge valve 4. Flow controlled

FUNCTIONS. SERVO SUPPLY PRESSURE FEED

Servo supply pressure delivers the force needed to change the position of the swash plate in variable displacement and pressure regulated motors. For equipment options for Series 02 motors please refer to the model code.

For HMV-02 variable motors
Internal supply. Purge circuit

External supply. Purge circuit

For HMR-02 Regulating motors
Internal supply. High pressure circuit

- A, B Work ports
- L, U Case drain / vent connections
- E Make-up connection

FUNCTIONS. CROSSLINE RELIEF (SECONDARY) PROTECTION

The secondary valves (crossline relief valves) protect the system from pressure overload by using two interlinked pressure relief valves (combined with check valves). It is recommended for applications where this protective function is not provided by other means (e.g. through primary protection at the pump or LS valves). The secondary protection includes a make up function. It prevents cavitation and is required in an open loop circuit if the motor requires more oil than is supplied. For special situations like in the swing gear drive the installation of controllable secondary valves is recommended. For equipment options for Series 02 motors please refer to the model code.

Without crossline relief valve

With crossline relief valve protection

With dual pressure crossline relief valve protection

- A, B Work ports
- L, L1, U Case drain/vent connections
- X, Y Control connection for dual pressure crossline relief valve
- E Make up connection

FUNCTIONS. SIGNAL SELECTION FOR PRESSURE REGULATOR

Pressure regulated motors shift to maximum displacement at high operating pressure, irrespective of which side is under pressure. In propel drives this can have undesirable effects. For example, if the motor shifts to maximum displacement during the transition phase from straight travel with low system pressure to overrun (deceleration, downhill travel) with high pressure on the reverse side, an extremely strong vehicle braking effect will occur. The signal selection for pressure regulator prevents the regulator being subjected to this braking pressure and, therefore, ensures that the motor remains at minimum displacement. For equipment options for Series 02 motors please refer to the model code.

Without signal selection for pressure regulator

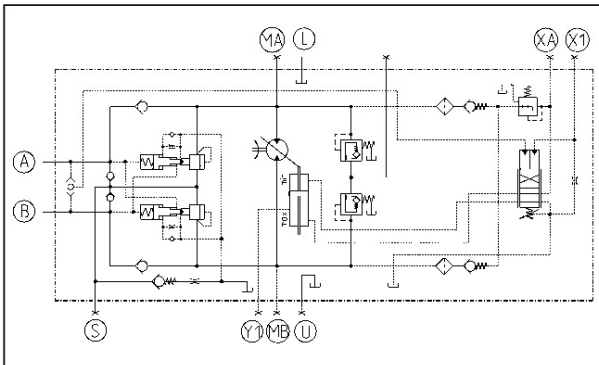

With signal selection for pressure regulator

FUNCTIONS. COUNTERBALANCE VALVE

The counterbalance (brake) valve prevents the motor over speeding during an over-run situation. To achieve this, the motor return flow is automatically and continuously metered such that it always matches the input flow. Different braking responses are possible. The integrated make-up function simultaneously prevents cavitation. A purge and case flushing function is also integrated. Counterbalance (brake) valves are typically used for drive systems in open loop circuits. The function of the high pressure relief valves can be integrated in the counterbalance valves. Further types of counterbalance valves are shown in section "Dimensions. HMR-02".

With counterbalance (brake) valve, here: axial attachment

Dimensions

Brake valve	1"	1 ¼"
Length L	168.5	168.5
Width B	165.7	195
Height	136.6	143

FUNCTIONS. SPEED SENSOR

Speed sensors electronically register the motor speed and send an associated input signal to electronic drive controls. Examples are shown below.

Without speed sensor

With speed sensor

MOTOR TYPES.

Based on the respective system requirements, Linde Hydraulics offers fixed displacement, variable displacement and regulating motors with high starting torque for open and closed loop operation. Optional auxiliary functions, zero displacement capacity and PTO through-shaft enable higher machine design flexibility and increase the efficiency of the travel drive. The motors are optionally controlled electrically, hydraulically or pneumatically.

Further features

- >> optionally with purge valve for circuit and case flushing in closed loop circuit
- >> system pressure regulation, no external control lines required
- >> signal selection for pressure regulator for closed loop circuit
- >> counterbalance (brake) valve CBV optional

Product benefits

- >> smooth low-speed operation
- >> high starting torque
- >> wide conversion range
- >> compact design
- >> high power density
- >> high reliability
- >> long service life
- >> highly dynamic response characteristics
- >> simplified drive line

MOTOR TYPES. HMR-02

Linde regulating motors are suitable for open and closed loop operation. They are high-pressure regulated and shift to minimum displacement V_{min} at system pressures below the regulation begin point. When the defined high pressure regulation set point is reached, the motor smoothly increases displacement to match the torque required by the system.

The following data are independent of the rated motor size.

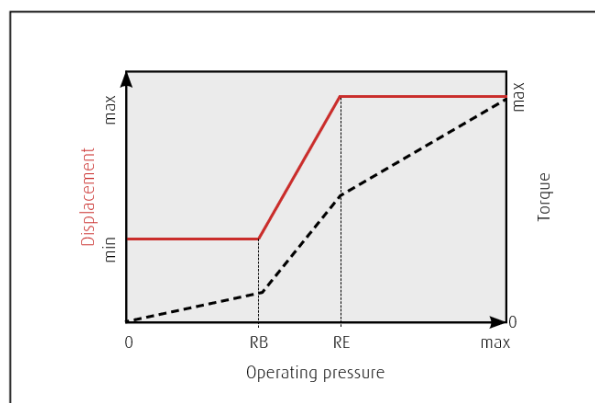

Typical equipment options

- >> Open loop circuit. Secondary (crossline relief) valves or counterbalance (brake) valves
- >> Closed loop circuit. Electric signal selection for pressure regulator

Regulating motor features

Hydraulic regulation	Regulation begin pressure adjustable, please specify with the order	bar	190 to 260	
	Regulation end pressure	bar	5% above regulation begin pressure	
Pneumatic V_{max} override control	Shift pressure min/max	bar	4 to 8	
Hydraulic V_{max} override control	Shift pressure min/max Low pressure	bar	20 to 30	
	Shift pressure min/max High pressure	bar	30 to 420	
Electronic control signal	Connector type		DIN EN 175301-803, Deutsch, AMP Junior Timer (2-pin, Cod. 2)	
	Rated voltage = max. continuous voltage	V	12	24
	Voltage type		DC Voltage	
	Power input (cold)	W	≤ 26	
	Relative duty cycle	%	100	
	Protection class		IP54 (DIN), IP67 (Deutsch), IP 6K6K (AMP)	
Minimum response time with standard orifice with 20 bar servo pressure		s	0.3 - 0.6	

Regulating motor characteristic

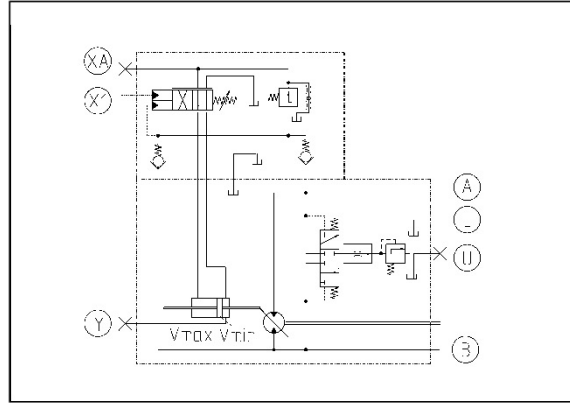

- RB Regulation begin
- RE Regulation end
- Displacement
- Torque

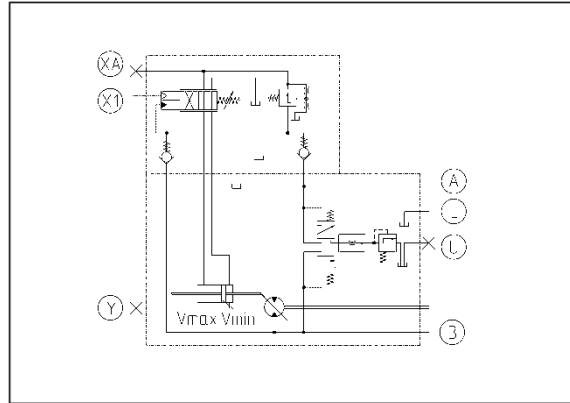

MOTOR TYPES. HMR WITH V_{max} OVERRIDE CONTROL

The additional V_{max} control enables fixed displacement motor operation independent of the control pressure.

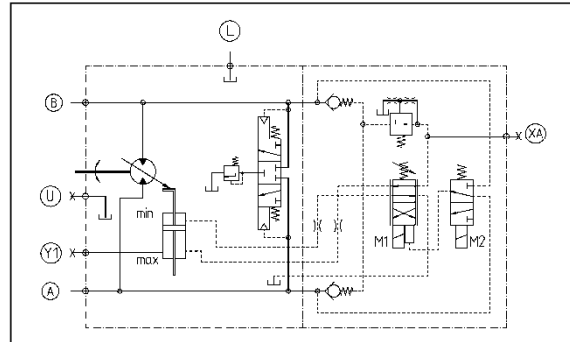

Regulating motor with hydraulic V_{max} override control

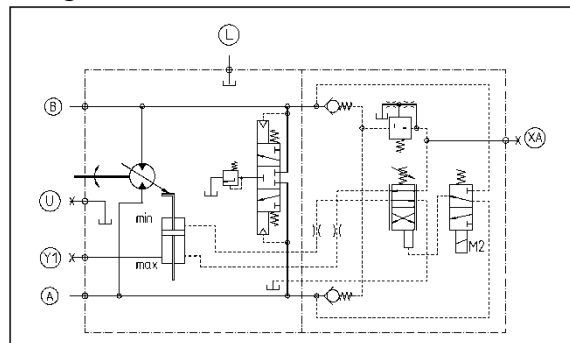

Regulating motor with pneumatic V_{max} override control

HMR-02 with electric V_{max} override control and signal selection for pressure regulator

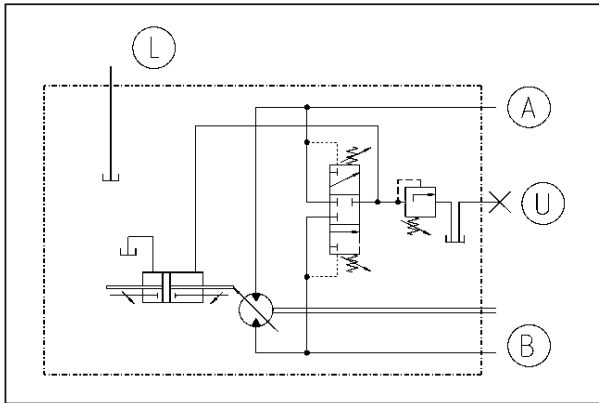

HMR-02 with electric signal selection for pressure regulator

MOTOR TYPES. HMA-02

The HMA-02 motor is a high-pressure motor with adjustable displacement for open and closed loop operation. For application which requires dependent on the situation a reduced or increased displacement, the HMA-02 offers the expected flexibility. Since the displacement can be adjusted on request stepless at a screw. For a well-adjusted torque.

HMA-02 the adjustable fixed displacement motor

- A, B Work port connections
- L, U Case drain / vent connections

MODULAR SYSTEM FEATURES.

The Series 02 motors are based on a modular system with the following characteristics. This enables our distribution partners to configure the product according to your requirements. The latest characteristics and available options can be taken from the model code, which is available on our homepage.

- >> V_{min}
- >> Mounting flange
- >> Drive shaft
- >> V_{max} control
- >> Control orifice
- >> Secondary valves
- >> Direction of HP-connections
- >> Purge valve setting
- >> Shuttle valve
- >> Drain port U, L1, L2
- >> Coupling flange
- >> PTO Through-Drive
- >> Port threads
- >> Type of control
- >> Remote control pressure
- >> Start of control
- >> Voltage for E-controls
- >> Connectors for E-controls
- >> Displacement fixing
- >> Speed sensor
- >> Pilot pressure compensation
- >> Surface treatment
