- Connecting dimensions to ISO 4401.

KV-4/3-5KO-6-R, KV-4/3-5KO-10-R

Operation

Directional valves type KV with direct mechanical operation by means of a lever control the direction of the hydraulic fluid medium flow.

These directional valves consist of a housing (1), control spool (2), control mechanism (3), and return spring (4). In 4/3-way directional valves the centre position of the control spool is the neutral position. The change-over to one of the operating positions "a" or "b" is done by moving the operating pin lever (5) in such a manner that its acts on the control spool (2) so as to clear corresponding flow ways and establish relevant links between ports, A, B, P, and T.

On ceasing to apply force to the control mechanism (3), the return spring (4) push the control spool into the neutral position.

There are two types of operation:

- 1/ With control spool not held in the operating position (the control spool returns to neutral position on ceasing to apply force to the control mechanism - type KV-...-R).
- 2/ With control spool held (detent) in the operating position (the control spool remains in the operating position on ceasing to apply force to the control mechanism lever - type KV-...-RA).

- Threaded connections to ISO 9974 (Metric), ISO 1179 (BSPP/Gas).

KV-6/2-6-R..., KV-6/2-10-R...

Operation

Directional valves type KV with direct mechanical operation by means of a lever control the direction of the hydraulic medium flow. They are mostly used as link between two consumers and the basic directional valve, when we want to control both consumers alternately by means of one basic directional valve.

There are two types of operation:

1/ With control spool not held in the operating position (the control spool returns to position "a" on ceasing to apply force to the mechanism - type KV-...-R).

2/ With control spool held (detent) in the operating position (the control spool remains in the operating position on ceasing to apply force to the control mechanism lever - type KV-...-RA).

4/2 WAY AUTOMATIC DIRECTIONAL VALVES PKV-...-T (NG 6)

- NG 6
- Up to 210 bar [3 045 PSI]
- Up to 30 L /min [7.9 GPM]
- Connecting dimensions to ISO 4401.
- Automatic, load - independent reversal.
- Predefined actuator direction at start - up.

PKV-6-T, PKV-6-T-G

Operation

These valves reverse the movement of an actuator every time the flow through the valve stops. Preferential starting is P → B and A → T position. The spool is moved by two springs and locked by unbalanced pressure inside valve. When no more flow is crossing the valve, the spool changes the position inverting the direction of the actuator. These valves are mostly used to control the movement compactors or system where it is not possible to use electrical device.

About the spindle for the PKV-6-T-G valves:

The spindle for the PKV-6-T-G valves is used just to set the system pressure limiter. To set the maximum pressure you have to block the self-reversing function.

Procedure to set a pressure on the system pressure limiter:

- 1/ Switch off the pump or reduce pressure to minimum (10 bar max).
- 2/ To set the system pressure limiter first block the automatic reversal of the valve. Remove the dome nut and turn the offsetting spindle clockwise until it hits its inner end stop. The spool is now clamped P to B and A to T.
- 3/ Start the pump and set the required pressure.
- 4/ After that stop again the pump.
- 5/ Turn the offsetting spindle anticlockwise until it hits its outer end stop then put the dome nut back.

Never turn the offsetting spindle when the valve is pressurized over 10 bar [145 PSI]. This can cause seal damage. If necessary switch off the pump.

- Direct hydraulic operation.
- Connecting dimensions to ISO 4401.
- Threaded connections to ISO 1179.

KV-4/3-5KO-6-H, KV-4/3-5KO-10-H

Operation

The KV-...-H is a hydraulically controlled 4/3 or 4/2 way directional control valve. The valve is operated by the pilots ports X and Y via the connection of an external pilot pipe direct on the valve body.

The minimum pilot pressure must be ensured for all operating conditions of the directional valve.

2/2 WAY DIRECTIONAL VALVES KV (NG 6)

- NG 6
- Up to 210 bar [3045 PSI]
- Up to 30 L/min [7.9 GPM]
- Direct in-line mounting.
- Threaded connections to ISO 1179 (BSPP/Gas), ISO 11926 (UNF).
- Hermetically sealing at closed flow path.
- No STICK-SLIP effect even after a prolonged dwell time under pressure.
- Plug-in solenoid connector to ISO 4400.
- Protection of solenoid IP65 to EN 60529 / IEC 60529.
- Fulfil EMC (89/336/EEC).

KV-2/2-6-S-..

Operation

Directly-operated directional seat valves KV are used for the control of direction of hydraulic fluid.

KV-2/2-6-S-A-...

In the start control position a, the return spring (4) holds the ball (2) in its open position, thus freeing the flow path between ports A and B. The change-over into the control position b is accomplished by energizing the solenoid (3), whereby the ball (2) is pushed against the seat (1). The hydraulic fluid on port A is under pressure.

KV-2/2-6-S-B-...

The hydraulic fluid on port A in the start control position a is under pressure. The return spring (4) pushes the ball (2) against its seat (1). The change-over to the control position b is performed by energizing the solenoid (3), thus freeing the flow path between ports A and B.

The change-over can also be done manually by pressing the emergency manual override (5).

KVC-3/2-10

Operation

Directional valves type KVC-3/2-10 with direct solenoid operation are used to control the direction of hydraulic fluid flow.

Type KVC-3/2-10 is a reduced version of type KV-6/2. It is used for alternate control of two one-pipe working units (e.g. Plunger) with common, main directional valve.

It is also very proper as bypass valve.

The change-over can also be done manually by pressing the emergency manual override.

- NG 6
- Up to 350 bar [5 076 PSI]
- Up to 75 L/min [19.8 GPM]

- Connection diagram and connecting dimensions to ISO 4401.
- Plug-in connector for solenoids to ISO 4400.
- 5-chamber model with good spool guidance.
- Optimized flow paths for low losses of pressure.
- Adjustment of the switching time.
- Wet pin solenoid with interchangeable coil.
- Manual emergency control.
- Protection of solenoid IP 65 to EN 60529 / IEC 60529.
- Fulfil EMC (89/336/EEC).

KV-4/3-5KO-6

Operation

Directional valves type KV with direct solenoid operation control the direction of the hydraulic medium flow.

These directional valves consist of a housing (1), a control spool (3), and one solenoid (2) with two return springs (4) in 4/2-way directional valves, and two solenoids (2) with two return springs (4) in 4/3-way directional valves. In 4/3-way directional valves the centre position of the control spool is the neutral position. The change-over to the operating position (a) and (b) is done by energizing the solenoids (2) "a" and "b" respectively, whereby the solenoid plunger acts on the control spool (3) via the operating pin (5), thus clearing the corresponding flow ways and establishing relevant links between ports A, B, P, and T.

When the solenoid (2) is de-energized, the control spool (3) is returned to its neutral position by the return spring (4). The change-over can be done manually by pressing the emergency manual override (6).

KV-4/2-5KO-6-81

Directional valve with two operating position, two solenoids without springs allow the control spool to be held in the operating position (detent). The control spool remains in the operation position also when the solenoids are de-energized.

The operating limits of the valve are determined at a voltage 10% below the nominal rating. The curves refer to application with symmetrical flow through the valve (P-A and B-T). In the case of asymmetric flow (e.g. one part not used) reduced values may result.

Note: For valves with adjustment of the switching time reduced values of the operating limits may result.

Dimensions

Cartridge throttle

If flow rates greater than permissible occur during change-over, a cartridge throttle must be fitted into P-line of the directional valve.

Installation

The directional control valve must be installed horizontally (Nameplate on top). If this is not the case, the valve must be removed for venting. Unscrew the vent screw. Move the spool alternately to the switching positions a and b until no more bubbles appear at the screw hole. The oil must be visible at the screw hole. Missing oil should be refilled with an oilcan, drop by drop. Screw in the vent screw. A constant or short time static oil pressure of at least > 4 bar must prevail at connection T of the directional control valve to maintain the oil pressure in the spring chambers. If this is not the case, the preloaded oil volume of the restricted valve would leak into the T channel through the leakage section of the control spool shoulders. The dampening constancy also depends on the constancy of the oil viscosity. For this reason the dampening effect should always be adjusted with the system at operational temperature.

- Fulfil EMC (89/336/EEC).

KV-4/3-16-

Operation

Directional valves type KV with indirect, solenoid-hydraulic operation control the hydraulic fluid flow direction.

These valves consist of the main valve (1), a control spool (2), two return springs (3) in 4/3-way valves and none in 4/2-way valves, a double throttle check/valve (4) and a pilot valve (5).

The pilot valve (5) is connected with the pressure chambers (8) via the pilot line (7). Feeding of the pilot valve oil is either or external (via the port "x"). Change-over of the control spool to one of the operating position is activated by the introduction of oil via the pilot valve (5) into one of the pressure chambers (8). A pressure rise in chambers provokes the movement of the control spool (2). Suitable links between ports A,B,P,T according to spool types are established as set forth in the table.

When the solenoid of the pilot valve (5) are de-energized a link between the pressure chamber (8) and the return line "y" for the pilot oil discharge is established. A pressure drop in the chamber actuates the main valve return spring (3) which automatically return the control spool to the neutral position.

Discharge of the return pilot oil from the pressure chambers is either internal or external (via the port "y").

Manual change-over of the main valve is also possible by pressing the emergency manual override (9).

Indirect directional valves can also be provided with a manual pilot valve. These valves are manually operated by moving the operating lever.

See Model Code for spool type choice.

Cartridge throttle

If the pilot oil supply rate (x) is greater than permissible a cartridge throttle shall be fitted into the P line of the directional valve.

Pre-load valve

In valves with a low pressure bypass and internal pilot oil feed, minimum pilot pressure is obtained by installing a pre-load valve in the P-port of the main valve. The cracking pressure is approx. 4,5 to 6 bar [65 to 87 PSI].

Pressure reducing valve

The pressure reducing valve used when the pilot oil "X" pressure exceeds the permissible limit $p = 250$ bar [3 626 PSI].

Throttle check valve

The throttle check valve used for setting the supply flow rate of the pilot oil to the pressure chambers. Simultaneously, the change-over speed of the main control spool is adjusted. In this way a smoother change-over, without hydraulic shocks is provided.

- Fulfil EMC (89/336/EEC).

KVP-4/3-5KO-6

Operation

The KVP directional control valve is a proportional valve providing variable flow rates. This valve is used with control electronics. Typical applications are soft switching via adjustable ramps for the reduction of hydraulic and mechanical shocks, and electrically adjustable flow rates - speeds for automating machine functions.

This directional valves consist of a housing (1), a control spool (2), one or two proportional solenoids (3) and two return springs (4). The change-over can be done manually by pressing the emergency manual override (5).

VERTICAL STACKING FOR KVM VALVES

- NG 6
- Up to 350 bar [5076 PSI]
- Up to 40 l/min [10.56 GPM]
- Threaded connections to ISO 9974, ISO 1179 or ISO 11926.
- Possibility of stacking one, two or three vertical stacking components.

Mounting example

1. Bankable directional valve KVM-6
2. First stacking component (KVM-NOV-6)
3. Second stacking component (KVM-NDV-6)
4. Third stacking component (KVM-VV-6)
5. Mounting screws for vertical stacking components:
 - M5x55, ISO 4762-10.9 (for one stacking component) - ordering code: 1114573
 - M5x95, ISO 4762-10.9 (for two stacking components) - ordering code: 1253603
 - M5x135, ISO 4762-10.9 (for three stacking components) - ordering code: 1668356

Mounting screws tightening torque: max. 9 Nm [79.6 in.lbf]

Six different orientation options:

Sealing between stacking elements

CHECK VALVE KVM-NOV-6

- Up to 350 bar [5 076 PSI]
- Up to 40 l/min [10,6 GPM]
- Flow shut-off in both or one service line.
- For vertical stacking on KVM directional valves.

Operation

Pilot operated check valves type KVM-NOV-6 enables the hydraulic fluid flow in the service lines to be automatically shut off and made free, respectively.

Free flow direction is always from the valve side to the ports side. In the opposite direction is the valve blocked for the hydraulic fluid flow. Free flow in port A in direction from ports to valve side is achieved by means of pressure in port B and vice versa.

To assure zero leakage there is necessary to discharge ports A and B towards port T in the zero position of the directional valve.

Model code

THROTTLE WITH CHECK VALVE KVM-NDV-6

- Up to 350 bar [5 076 PSI]
- Up to 40 l/min [10.6 GPM]
- Flow control in both or one service line.
- For flow throttling in supply and/or return lines.
- For vertical stacking on KVM directional valves.

Operation

Throttle with check valves type KVM-NDV-6 are used for throttling flow of the hydraulic fluid in lines A and/or B. The KVM-NDV-6 valves are allowing free flow in one direction through check valve and throttled flow in reversed direction. Hydraulic fluid flow is throttled depending od adjustment of the throttling screw.

AUXILIARY CONTROL LEVER

- Compatible with KV-5KO-6, KVM-6 and KVP-5KO-6 directional valves
- Without impact on valve's performance.
- Up to 250 bar [3 625 PSI] on T port.

Description

The optional auxiliary control lever module offers solenoid or manual operation of directional valves. Control lever provides mechanical connection with main control spool without significant impact on valve's performance. Auxiliary control lever module is mounted between the valve housing and solenoid. During solenoid operation, hand lever remains in neutral position. Modular and robust design of auxiliary control lever enables installation on A or B side of various types of directional valves and operating pressure range up to 250 bar [3 625 PSI] on T port.

- Fulfil EMC (89/336/EEC).

KV-6/2-6-S50

Operation

Directional valves type KV with direct solenoid operation control the direction of the hydraulic medium flow. They are mostly used as link between two consumers and the basic directional valve, when we want to control both consumers alternately by means of one basic directional valve.

The KV type directional valves consist of a housing (1), a control spool (2), a solenoid (3) and a return spring (5).

Change-over to the operating position is done by energizing the solenoid (3), whereby the solenoid plunger acts on the control spool (2) via the operating pin (4), thus clearing the corresponding flow ways and establishing respective links between the ports P1, A, B and P2.

When the solenoid (3) is de-energized, the control spool (2) is returned to its neutral position by the return spring (5), thus establishing again the links between ports P1, C, D and P2.

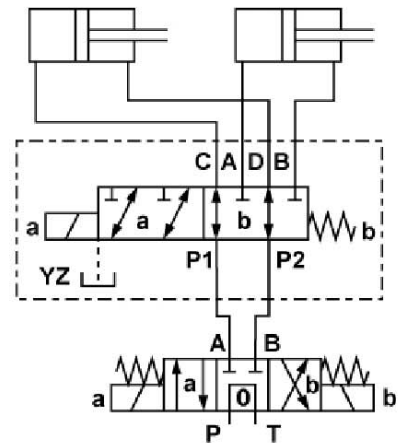

The change-over can also be done manually by pressing the emergency manual override (6).

- Up to 350 bar [5 076 PSI]
- Up to 120 L/min [31.7 GPM]
- Plug-in connector for solenoids to ISO 4400.
- Threaded connections to ISO 9974 (Metric), ISO 1179 (BSP/Gas), ISO 11926 (UNF).
- Protection of solenoid IP65 to EN 50529 / IEC 60529.

KV-6/2-10

Operation

Directional valves type KV with direct solenoid operation control the direction of the hydraulic medium flow. They are mostly used as link between two consumers and the basic directional valve, when we want to control both consumers alternately by means of one basic directional valve.

The KV type directional valves consist of a housing (1), a control spool (2), a solenoid (3) and a return spring (5).

Change-over to the operating position is done by energizing the solenoid (3), whereby the solenoid plunger acts on the control spool (2) via the operating pin (4), thus clearing the corresponding flow ways and establishing respective links between the ports P1, A,B and P2.

When the solenoid (3) is de-energized, the control spool (2) is returned to its neutral position by the return spring (5), thus establishing again the links between ports P1, C,D and P2.

The change-over can also be done manually by pressing the emergency manual override (6).

KV-8/3-6

Operation

Directional valves type KV with direct solenoid operation control the direction of the hydraulic medium flow. They are mostly used as link between three consumers and the basic directional valve, when we wish to control both consumers alternately by means of one basic directional valve.

The KV type directional valves consist of a housing (1), a control spool (2,3), two solenoids (4,5) with return spring (6,7). Change-over to one of the operating positions is done by combination of operation of solenoids (4,5), whereby the solenoid plunger acts on the control spool (2,3) via the operating pin (8), thus clearing the corresponding flow ways and establishing respective links between the ports P1, A, B, C, D, E, F and P2, as seen forth in the schematic diagram of a mounting example.

When the solenoid (4,5) is de-energized, the control spool (2,3) is returned to their neutral position by the return spring (6,7).

The change-over can also be done manually by pressing the emergency manual override (9).
